WBA GLOBAL BIOENERGY STATISTICS

The Global Bioenergy Statistics (GBS) report is the main annual publication of WBA.

The report focusses on the **global development of biomass to energy** – supply, production and consumption.

The data is presented on different geographical levels – global, continental and regional levels. These reports are published since 2014 and have been downloaded by governments, financial institutions, universities and companies.

WBA FACTSHEETS

WBA factsheets present an **unbiased** overview of bioenergy technologies and are a **guiding tool** for policy makers, researchers and companies.

The objective of drafting and publishing factsheets is to bring **rational arguments in the public discussion** and to **support the development of bioenergy**.

All factsheets are drafted along the same outline: summary, introduction, definitions, basic figures explaining technology, policy and economics, global statistics and a brief opinion of WBA on that subject.

WBA has already published 14 factsheets.

[illegible][illegible]

WBAI, INC. / SHOOT

CLEAN AND EFFICIENT BIOENERGY COOKSTOVES

SUMMARY

Globally, more than 2 billion people rely on traditional stoves for cooking and hot water, and it's bad for their health and the environment. There is an urgent need for developing clean and efficient cookstoves and fuels. Currently, the cookstove sector is growing rapidly with 50% increase in annual sales during 2003–2012. The growth is expected to continue further.

Clean and efficient cookstoves are important developments for improvement of both the environment and public health. Use of such cookstoves leads to better combustion of fuel and improved heat transfer leading to reduction in fuel demand, improved health of women and children and lower costs of cooking. Cookstoves give greatly in terms of performance across different models and designs. A set of metrics international guidelines for better performance was developed under the International Standard Organization leadership agreement process. This framework provides strategies to measure and classify performance including efficiency, emissions and safety. There are also a broad range of other factors such as affordability, accessibility, and fuel-hold-up impacts that are critical factors to consider.

Advanced systems require a number of design and manufacturing criteria as essential. Factors such as efficient fuel management, optimizing health of the cook, clean cook and renewable fuels like pellets, ethanol, electricity, etc., and proper assessment and control in providing the environment and public health. The objective of the World BioEnergy Association is to support the accelerated production and use of sustainable bioenergy and biomass. This can be done specifically through an intensive biomass fuel research and innovation based technology.

INTRODUCTION

Worldwide, especially in Africa, people are burning solid fuel, including biomass, agricultural residues and charcoal, for their daily cooking (1). This is a challenge as inefficient systems of cooking have a major impact on health, environment and economy (2). Biomass emissions released during the process of combustion represent one of the world's major public health challenges, and result in severe premature deaths (3). Health issues fall on those exposed and thereby increase the negative effect on the environment. Furthermore, fuel gathering can be dangerous as it forces women exposed to threats of violence, and cooking on traditional stoves is more smoky, preventing women taking on income generating work and often rendering children not attend school (4).

The World Resources Association (WRA), the objective is to support clean, efficient and secure production and use of sustainable biomass for cooking, industrial and other improved production (5). Biomass has been used for cooking since the beginning of human existence through simple stoves made of mud-brick. This further presents an overview of the biomass cookstoves and fuels that are currently available. WRA does not present a list of solid fuels. Issues of solid fuels like Liquidified Petroleum Gas (LPG) and biomass are widely used in cooking. However, it will not be covered in this article. With this background, it is evident that introduction of efficient and clean cookstoves have a great potential for use

Figure 1. A woman is preparing her food on a traditional brick stove in Lesotho, South Africa.

cooking to improve income in both the society and the environment. The WRA is a not-for-profit, charitable organization for the WRA, has National Adoption of Clean Cooking Initiatives, including both cookstoves and fuels, on its agenda, explaining the high impact opportunity of improved cooking systems for leading, clean, promoting life, the economical adoption, use important to cook, health, high quality and safety (6).

An important phase in the cookstove market is GACC. The Global Alliance for

Clean Cookstoves (GACC) is a public-private partnership based by the WRA foundation in making tools with some open systems towards a goal of one million households adopting clean and efficient cookstoves and fuels by 2020 (7).

BASIC COOKSTOVES

The most common traditional stove is the three stone stove (Figure 2). It is a simple construct where three stones are arranged in a triangle on the ground in order to position a cooking pot over the fire that will burn the biomass (8).

WRI Fact Sheet

ROLE OF BIOENERGY IN A CLIMATE NEUTRAL ENERGY SYSTEM

A SCENARIO COMPARISON

SUMMARY

Climate change today is what's happening here and now. Transition to a climate neutral energy system has multiple pathways, but fundamentally is underpinned by renewables, energy efficiency and conservation, electrification, hydrogen and its derivatives, and carbon capture and storage. Bioenergy as a versatile renewable source, with improved appliances and technologies, can facilitate this process through direct supply of green electricity, heat and fuel, indirect electrification in terms of conversion between biomass and hydrogen, and carbon sequestration with biochar and BECCS applications. In the power and heat sector, bioenergy functions as the best replacement for fossil fuels to provide grid flexibility, and feedstock blending can share the existing infrastructure while reducing the emissions intensity. In transport sector, biofuel will keep being the major renewable substitute and blend for fossil fuels before the extensive electrification, then gradually phase out and take up a large share in shipping and aviation. In industry sector, bioenergy will play an active part in circular economy by managing industrial waste, providing process heat and feedstock for chemical production. In building sector, bioenergy will enable the wide public access to green residential heating and clean cooking, and help improve the socioeconomic and health conditions of rural residents.

INTRODUCTION

Climate Change

Human activities have induced unprecedented change across the climate system, and it is no longer just an image about a fish slowly melting into the distant polar sea. Possibly, the occurrence of extreme weather events, such as heat and cold waves, droughts and heavy precipitation, wildfires and tropical cyclones, especially that compound, turn out to be increasingly frequent and intense. The Fifth Assessment Report (AR5) Working Group I (WG1) led by the United Nations' Intergovernmental Panel on Climate Change (IPCC) in August made it clear that since the 1950s the frequency and intensity of extreme weather events, rapid, and large-scale "actions" can be taken to drastically cut emissions, 3.5 °C warming will come in a very near future.

Nuclear Neutrality

Since anthropogenic emissions, especially burning fossil fuels, is the major climate driver to mitigate climate change, it is to accelerate the transition of energy systems to climate neutral energy systems, defined by the United Nations Climate Action Network (CAN) in the 2015 action climate New (BECCS) as an energy system with green. Now, in an energy system with green, low gas emissions (GHG) equal to or less than which can be actually achieved by the plant, such that it has "net zero" emissions. Transition towards a climate neutral energy system therefore will be a test with multiple objectives. First, phase out the

Figure 1: Climate change and the necessary decarbonization. Source: NABA.

energy systems with positive emissions and conserve their shares with low- or zero-emission sources. Second, ensure that they offer the positive emissions from sources or difficult to phase out. Third, maintain and improve the capability of natural sinks.

Energy Transition

Energy transition, given the objectives above, can mainly be factored into renewable, energy efficiency and conservation, electrification, hydrogen and its derivatives, carbon capture and storage (CCS). A variety of ways can bioenergy facilitate this process. As the main constituent of renewable mix today, bioenergy is characterized by its capability to supply electricity, as well as heat and fuels directly without losing carbon neutrality, while provide flexibility to fossil fuel power plants as a

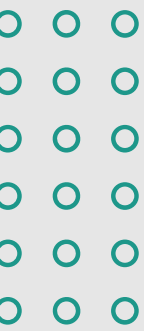

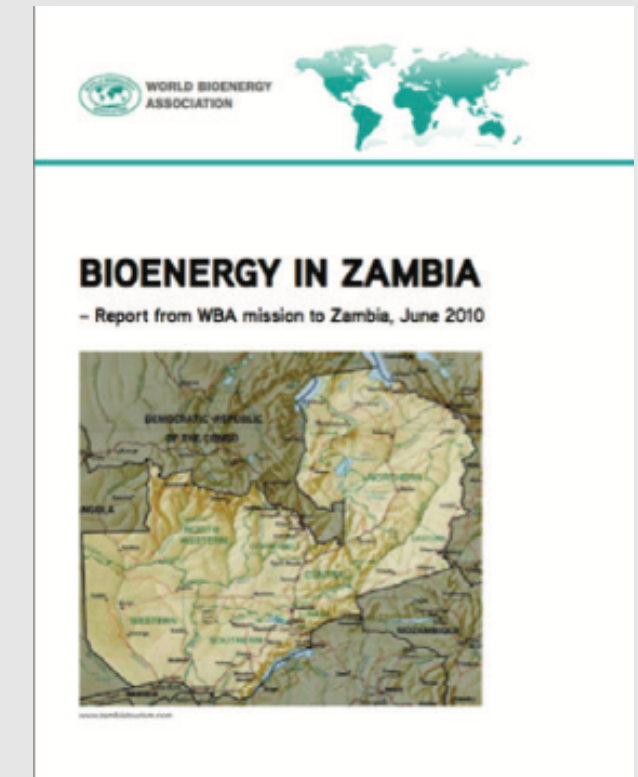

lower cost. Equipped with improved combustion, boilers or compressors, the efficiency of generation can be further enhanced. This procedure can even be carbon negative (i.e., BECCS) by combining with hydrogen or CCS (i.e., BECCS). Methane is interchangeable with hydrogen by nature, and power-to-gas is essentially indirect electrification as a means of energy storage. During these conversions, CCS can be reformed either into biomethane or into solid carbon for industrial and agricultural use. In terms of storing GHG, negatively, better management of agricultural residues and waste streams will significantly reduce its emissions, and this provides foundation for bioenergy in different forms. Before solidifying prospects on these interesting topics, we can first outline the status of bioenergy in the energy system today.

WBA COUNTRY MISSIONS

WBA has been conducting successful country missions to **share knowledge and experience** on bioenergy.

We have had missions to Zambia, Brazil and Kenya, for example, in the past few years. During the trips, WBA contributed with **expertise** by attending conferences, conducting **field trips** and **giving presentations** on the role of biomass in climate change.

These trips have been on the invitation of local country representatives.

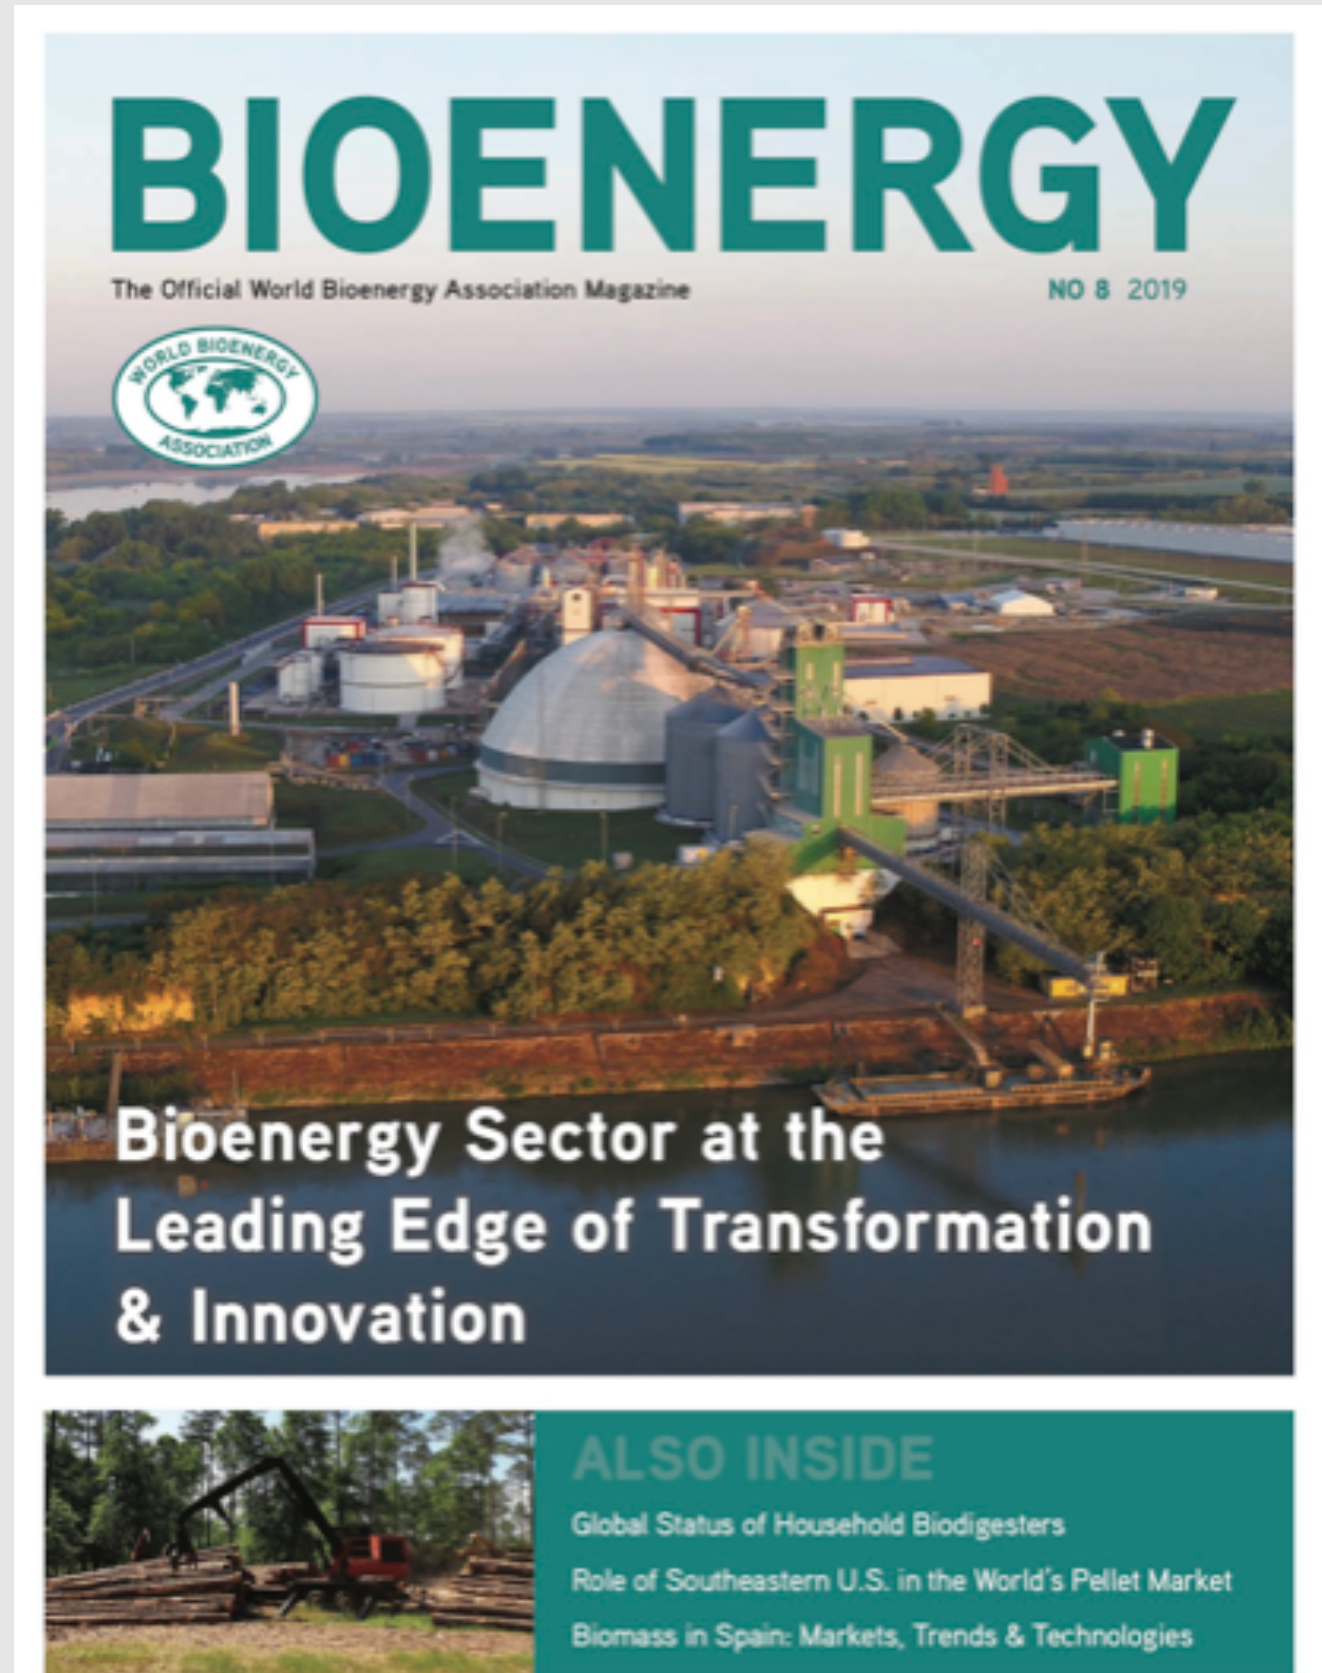

BIOENERGY MAGAZINE

The bioenergy business needs a voice on the international arena. During the launch of the World Bioenergy Association in Jönköping, Sweden at the World Bioenergy Conference, a magazine was released with the objective of **spreading the message on the need for a global association of bioenergy.**

Eight magazines have been released since 2008 **keeping track on the development of WBA** as an organisation along with **developments in the bioenergy field.**

Recently, WBA was pleased to announce a new partnership with Bioenergy International, who became the **official magazine of World Bioenergy Association.**

POSITION PAPERS

WBA frequently issues position papers to **inform the bioenergy and wider energy community** about the opinion of WBA on various technologies, policies and debates surrounding bioenergy.

These are issued either by WBA or jointly with other leading organizations.

**RENALLIANCE**
renewables working together

Joint statement on Renewables working together Building Back Better through a Green Recovery

The renewable industries will work together to deliver 100% renewable energy. This can only be achieved through renewable energy integration. Together, the renewable energy technologies are greater than the sum of their parts. A significant increase of investment in renewables will fuel economic growth, create employment and contribute to a climate-safe future. To ensure this, we call for the following:

- **Accelerated deployment across all sectors, especially in heating, cooling and transport sectors, also by connecting the sectors.**
The uptake of renewables in heating, cooling and transport remains slow, even though these sectors account for over three fourths of total final energy demand. Policy attention in this area is still lacking.
- **Substantial financial incentives for renewables to create competitive advantage for end-users and encourage self-supply.**
The deployment of renewables in the energy sector still faces multiple barriers. Further policy support is needed to advance the achievement of a 100% renewable energy future. Policies ranging from pricing instruments to financial and fiscal incentives, quotas, and obligations, are needed to support clean, efficient and renewable energy projects.
- **Consider additional benefits and services of renewables when designing market mechanisms, not just lowest price.**
The socio-economic benefits of the transition to a 100% renewable energy future is of vital importance. Mitigating climate change through the deployment of price competitive renewable energy need to be considered to future-proof our economy and society.
- **Broader policy frameworks devoted to a just and inclusive energy transition.**
Renewable energy technologies lie at the heart of the energy transformation. This transition should focus on deployment, enabling and integrating policies that attract the full variety of investors, from individuals, communities, SMEs up to larger companies to participate and invest.
- **Development of green skills and renewable jobs offered to communities.**
Incentives for education and training are needed to match the future skills demand for the energy transition. These incentives should address social and gender equity.
- **Mapping and promotion of health benefits of a green energy-based economy.**
Replacing fossil fuels with renewable energy technologies is a positive force for climate, health and society.

Page 1

**WBA POSITION ON COVID19:
IMPACTS AND OUTLOOK FOR BIOENERGY**

BIOENERGY AS ESSENTIAL SERVICE. Bioenergy (including solid biomass, liquid biofuels and biogas) has provided clean, on demand energy and its role in meeting end use of electricity, heating and transport fuels should be recognized as essential product and service in times of crisis.

A BIOENERGY FUTURE. Policy makers should assure investors and the wider bioenergy community of their support to bioenergy and its crucial role in reducing fossil fuel use, generating jobs, local economic development and combating climate change.

DIS-INCENTIVIZE FOSSIL FUELS. Low oil prices, low cost of renewable energy sources and the momentum towards a clean energy future provide the opportunity for policy makers to disincentivize fossil fuels development by eliminating subsidies, implementing carbon pricing policies and developing fossil fuel exit strategies.

BUILD BACK BETTER WITH BIOENERGY. Recognizing the crucial role of bioenergy in the global energy mix, governments should include support to sustainable bioenergy technologies and pathways as key themes at the centre of economic recovery packages. No more fossil fuel support.

TIME FOR AMBITION AND ACTION. Recognizing that we face a climate urgency, national governments must increase their climate ambition by setting long term, ambitious and stable targets for bioenergy and renewable energy.

June 2020

Carbon tax – key instrument for energy transition!

Global warming is the most challenging problem facing humanity today due to the excessive use of fossil fuels. Carbon tax (carbon dioxide tax) is a simple and efficient way to reduce the use of fossil fuels, improve energy efficiency, and make renewables more competitive. It can be tax neutral, as reducing other taxes will complement carbon tax implementation. It is a smart move to a more sustainable lifestyle and investment for the future. Therefore, the carbon taxes are an indispensable tool for rapid transition to a climate compatible energy system using less fossil fuel and more renewables.

- **Easy to apply**
All countries already have some kind of energy taxation and it is administratively easy to introduce the carbon tax in all countries at a low level.
- **Easy to calculate**
The tax is easy to calculate based on the carbon content of the fuel and the importers or big energy producers can easily estimate and pay the tax.
- **Tax neutral**
Carbon tax must not lead to higher taxation in general. The Carbon tax can be raised at the same time as other tax is reduced.
- **Economic**
The Carbon tax will make it more profitable to use fossil fuels efficiently, switch to renewable energy sources or to obtain from using fossil energy altogether. For countries with large fossil fuel imports, the carbon tax can stimulate the internal economy and improve terms of trade.
- **Efficient**
The purpose of carbon taxation is not to punish people for their life style or technical equipment today, but to help them make the right choices and investments for the future.

Background and theory
Polluter Pays Principle and Carbon Dioxide Tax. Internalizing environmental costs: According to Polluter Pays Principle (PPP), emitters of CO₂ should pay a Carbon tax for their emissions and in this way pay for current and future costs caused by the emission. Hence, the environmental costs (external costs) are internalized and make a part of the total cost of the polluting activity.

Carbon content of the fuel as basis: The Carbon tax should be in relation to the emission of CO₂ by the different fossil fuels. This is well known, and in direct relation to the carbon content of each fuel.

The Swedish example: Sweden introduced carbon tax in 1990. Since then Sweden has experienced rapid economic growth and decreased carbon emissions. GDP increased by 80 percent in real terms. Swedish gas emissions decreased by 20 percent 1990-2014, and the use of bioenergy doubled. The diagram shows changes from 1990 (1990 = 100 percent).

Applied to all sectors: The Carbon tax should be introduced in all sectors of society. If cap and trade is used for certain sectors, Carbon taxes should be adopted for other sectors and in the long run, it should replace cap and trade system.

General acceptance needed: Initially, the level of the Carbon tax is not the main issue. More important is to get a general acceptance. Once the tax is introduced, it can be raised gradually to make it possible for companies and individuals to take action to reduce their use of fossil fuels.

A green tax shift: The purpose of the tax is not to increase taxation, but to steer the economy in a sustainable direction. Other taxes can be lowered to compensate for the raised Carbon tax, in a "green tax shift". If the tax shift is not applied, income from the Carbon tax can be used for research and development of renewable energy technologies or for adaptation and compensation for people affected by the emissions.

January 2016

We call upon governments to take the low price of oil as a window of opportunity to act against fossil carbon emissions!

There has rarely been such an opportunity for the global community to take action against fossil carbon emissions and global warming as there is now, in January of 2016. The North Sea Brent oil price has plummeted from 110 USD per barrel last summer to around 60 USD now, a fall of more than half, which will dramatically affect energy markets. All users of oil products at market prices around the world will now perceive their diesel, petrol and fuel oil as cheap.

This gives us a unique opportunity to introduce and raise fees and taxes on carbon dioxide emissions in all countries, keeping it painless for citizens. It represents also a chance to abolish subsidies for fossil fuels in countries with governmentally guaranteed fuel prices. The best strategy would of course be to agree a minimum carbon emission fee in the UN, but it is difficult to reach consensus by negotiation between so many countries. Therefore every government should consider urgently acting on its own, not waiting for global agreement. There are three types of country that should take action as soon as possible:

1. Countries that already have carbon fees or taxes should take the opportunity to raise these. As an example, in Sweden, petrol and diesel prices have decreased by over 2 SEK per litre (20 euro cents) and there is a clear opportunity to raise fuel duty by up to half that amount, without much consumer reaction. The situation is similar in all European countries, many urgently need to strengthen their state budgets by increasing revenues. Higher carbon fees, duties or a tax is one way to do it.
2. Countries with no fees or taxes on carbon emissions should introduce such measures now, both on fossil transport fuels and on fossil fuels for heating. They can introduce such taxes at a lower level, but with the current drastic fall in oil prices, even relatively high carbon dioxide fees may be accepted by consumers. The important thing is to act now, before oil prices climb again.
3. Finally, countries with fixed and state-guaranteed prices on fuels, many of which are oil-producing nations, should take away the guarantee. Guaranteed prices vary between country, but total subsidies are very high at the global level. When world market prices for oil were climbing some years ago this resulted in budget problems for many countries. One example is Nigeria, where President Goodluck Jonathan tried to abolish the country's fixed fuel prices, resulting in protests and rioting. Now, these countries have a chance to abolish such policies and even introduce a low carbon fee. When oil prices start to climb again, it will mainly be attributed to market prices.

There is convincing research showing that carbon emission fees are the most efficient general method to combat climate change. The main reasons why carbon fees are so efficient are:

- Carbon dioxide fees raise the price of fossil emissions and thereby penalize fossil fuels for their negative effects on the climate. Consequently carbon dioxide fees also favour renewables and energy efficiency.
- Carbon dioxide fees are fair and logical because they are proportional to the actual emissions. Increased costs on emissions thus help individuals and enterprises to make better decisions for our common future. They can calculate new profitable investments or change behaviour to improve their economy, e.g. buy a more efficient car, insulate the houses, take the bike instead of the car, or use public transport. Businesses can develop new products that can be competitive on a market where more efficient products are in demand, etc.

**WORLD BIOENERGY ASSOCIATION**

FES 2030 AFTER COP 21 (PARIS): FOSSIL EXIT STRATEGY 2030

One year after the conference in Paris, the world is moving away from the targets of COP21. The most embarrassing fact is the ongoing increase of the CO₂ concentration in the atmosphere. This concentration reached 400ppm in 2014 for the first time in the human history. A value of 420 ppm is usually regarded as upper limit to keep a temperature rise below 2°C likely (Source: IPCC)

The main reason of this growing concentration of CO₂ in the atmosphere is the huge inflow of CO₂ emissions caused by burning fossil fuels. Moreover, the oil prices have dropped 50% in the past two years which is an incentive to use more fossil fuels and thus increase emissions further.

If the flow of CO₂ emissions continues for another decade at the same pace, the threshold of 420 ppm CO₂ in the atmosphere will be surpassed and the targets of COP21 agreement will be unreachable for centuries!

The world needs an exit strategy to leave fossil fuels, step by step and year by year. A minimum reduction path, in terms of fossil fuel energy consumption, would be from the current 463 EJ in 2013 to 300 EJ by 2030 and near zero by 2050.

At the same time, each country needs a strategy for fast deployment of renewable energy sources including solar, wind, bioenergy, geothermal and hydropower. The world must move towards a 100% renewable energy before 2050 to achieve the Paris COP21 targets.

Figure 1 Global use of fossil fuels (2013 – 2050)

Fossil exit strategy for Europe:
Similar to the global scenario, Europe is moving away from the targets of COP 21. In 2015, the emissions increased as compared to 2014. The EU targets for 2030 – reduction of 40% emissions as compared to 1990 and 27% renewable energy share - do not comply with the targets of COP 21. Europe also needs a fossil exit strategy to achieve the targets of Paris. The

PELLETS.AFRICA

We believe Africa is going to be the next very large market for pellet production and use and we can see rapidly growing numbers of inquiries and projects emerging.

Because of the enormous potential and the relevance of pellet cooking for sustainable development and climate protection the World Bioenergy Association has set up the **website www.pellets.africa** to **support African developers of pellet plants**. This website includes a section that **lists all relevant suppliers**. We have a specific **working group on advanced biomass cooking** that open for all members interested in the subject.

If you are interested in presenting your company in the Pellets.Africa website or in becoming member of the World Bioenergy Association please feel free to contact the Executive director of our organization, Mr. Bhardawaj Kumamuru: bharadwaj.v.kummamuru@worldbioenergy.org

WEBINARS

Since the beginning of the pandemic, WBA started organising multiple webinars on a wide range of fields. For multiple times, representatives of exemplar organizations and associations gathered to discuss pressing subjects and to share experiences about their own line of activity. The recordings are of these events are made available to the public in our website.

 **Unlocking Net Zero through investment in sustainable bioenergy and BECCS**
2021 November 09

One of COP26's events, where the role of sustainable bioenergy and BECCS in delivering global Net Zero was explored.

BECOME OUR MEMBER:
<https://www.worldbioenergy.org/benefits/> **#2021recap**

 **Scaling up biomethane on the pathway to a Net Zero future**
2021 October 13

A webinar that showcased the latest global developments and best practices in the field of biomethane, covering new market trends, innovative policies and technology advances.

BECOME OUR MEMBER:
<https://www.worldbioenergy.org/benefits/> **#2021recap**

 **Bioenergy and Net Zero**
2021 September 27

A event that examined the varied roles of bioenergy in a Net Zero future and how we can maintain a strong focus on sustainability governance.

BECOME OUR MEMBER:

Istanbul 2016

Nairobi 2015

BIOENERGY FOR THE FUTURE

In the face of climate change, providing reliable supplies of renewable energy has become one of the biggest developmental challenges of our time, and bioenergy has a significant role to play in carbon removal and emissions reduction, as well as in the development of bioenergy-based fuel alternatives for fossil fuels.

Thus, WBA has partnered with **ITN Productions Industry News** to make Bioenergy for the Future, a programme, fully available to the public, that looks at the **innovations and developments in the Bioenergy sector**.

COLLABORATIONS

- Observer organization, UNFCCC
